

Endoscopic Ultrasound

Call for Papers: Special issue on Endo-hepatology

Endoscopic ultrasound has been widely used to evaluate hepatobiliary diseases, such as cirrhosis of the liver, portal hypertension, liver carcinoma, hepatic cyst and so forth. Especially, EUS guided fine-needle aspiration is very valuable in the diagnosis of focal liver lesions, cirrhosis and perihepatic adenopathy. Moreover, under EUS guidance some blood vessel interventional techniques can be applied for the treatment of varices caused by cirrhosis, and several kinds of ablative techniques can be used for hepatic lesions.

Therefore, a special issue focusing on application of EUS in hepatology will be greatly anticipated. We invite investigators to contribute original research articles, review articles, images and videos as well as commentaries on the topic to be published in this special issue, to promote dissemination of recent knowledge and developments in the field.

Authors can submit their manuscript via our online submission system at <http://www.editorialmanager.com/eus>.

Deadline for submission: May 31st, 2017

Publication date: August, 2017
